

2024* Water Quality Report

177,000 Constituents | 15% Rely on Private Wells for Drinking Water

Neonicotinoid Detects

Between 2019 and 2023, <1% of state-tested wells contained one of three neonicotinoids. New Berlin

Nitrate Exceedances

From 2022 to 2024, no wells sampled exceeded the Preventive Action Limit for nitrate in drinking water.

Drinking Water Quality Violations

No public water systems reported contaminant violations between 2022 and 2024.

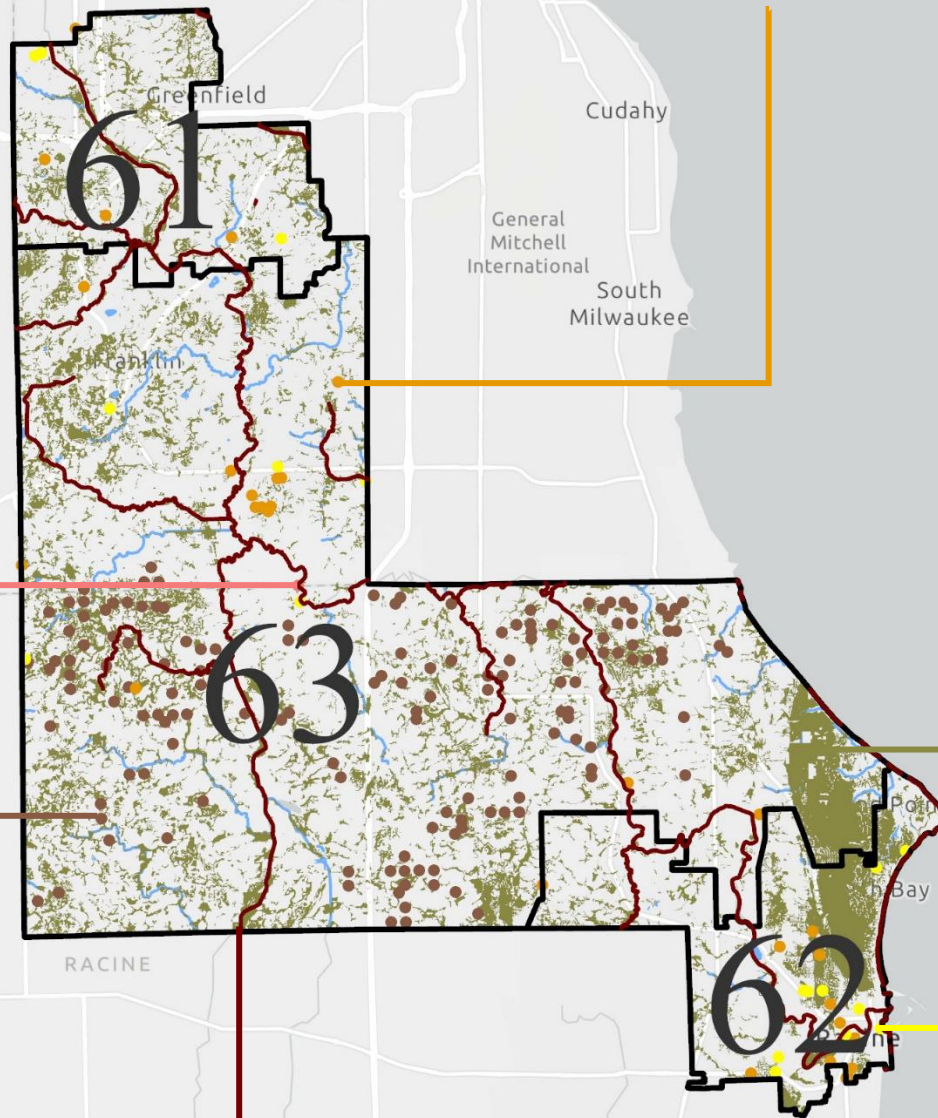

PFAS Sources and Detects

There are 25 presumed PFAS sources, and 18% of state-tested wells had at least one of the chemicals in 2023.

Wetland Loss

More than 19,600 acres of wetlands are categorized as lost but potentially restorable.

Biosolids/Waste Landspreading Sites

Septage, municipal, and industrial wastes are applied to over 3,700 acres.

Impaired Surface Waters

Over 6% of total lake acres and 58% of river and stream miles are listed as impaired.

Outstanding Exceptional Surface Waters

No rivers, streams, nor lakes are classified as quality surface water.

Groundwater Contamination Cleanup Sites

Nineteen groundwater sites are listed as contaminated.

- **No private nor public wells sampled exceeded the Preventative Action Limit from 2022-2024.¹**
- Elevated levels of nitrate are generally due to agricultural runoff and industrial discharges.
- Nitrate has been linked to blue baby syndrome, colon cancer, thyroid disease, and neural tube defects.

- **Current permit holders have applied over 682,000 gallons of waste to over 200 separate fields.²**
- The liquid and solid waste is generated from paper mills, septage operations, and food processing plants.
- Landspreading waste can transport contaminants by contaminating groundwater and food and feed crops in the area.

- **Two private and two municipal wells tested by the state had detectable levels of PFAS in 2023.³**
- The 25 presumed sources include facilities that manufacture, manage, and/or discharge PFAS materials.⁴
- PFAS consumption can cause developmental effects in children, decreased fertility, and some cancers.

- **From 2019-2023, one private or monitoring well sampled contained one or more neonicotinoids.⁵**
- Neonicotinoid insecticides are applied to agricultural crops, lawns and gardens, golf courses, and more.
- Negative impacts to non-target insect species cause food chain issues in fish, birds, and potentially other taxa.

- **No federal drinking water violations occurred in public water systems from 2022-2024.⁶**
- Common contaminants such as bacteria and metals often enter drinking water from agricultural and natural sources.
- Sustained ingestion at high levels can cause gastrointestinal ailments and developmental issues, respectively.

- **Fourteen groundwater sites are contaminated with PAHs, solvents, gasoline, heavy metals, and/or VOCs.⁷**
- These chemical mixtures enter water through industrial discharges, storage tank leaks, and landfill leachate.
- If ingested through drinking water, the pollutants pose serious cancer and organ damage health risks.

- **Of the thousands of wetland acres lost, 21% of the total land acreage has the potential for restoration.³**
- Degradation and loss of Wisconsin wetlands is primarily due to invasives, development, and conversion to cropland.
- Wetlands absorb pollutants before they enter water, including drinking water; without them, we lose natural filters.

- **More than 15 acres and 75 miles of surface waters are listed as impaired under the Clean Water Act.³**
- The mercury, phosphorus, lead, and/or PCBs throughout are often from agricultural and industrial discharges.
- Ingestion of these pollutants can lead to organ damage, cardiovascular and reproductive issues, cancer, and more.

- **No surface waters are classified as Outstanding or Exceptional Resource Waters by the state.³**
- These waterbodies support fisheries and wildlife and have high water quality from effective management and protection.
- As some drinking water is sourced from surface water, these are essential public health resources, too.
